

Dear Sir/Madam,

My journey with engineering started with breaking systems apart to see how they function. The logics behind mathematical models, electronic circuits and decision making processes increased my curiosity and helped me to precise my aim to study electrical engineering and apply the knowledge to the real world to make impactful systems.

With focus and diligence, I earned a GPA of 5.00/5.00 in my Secondary School Certificate and continued in the Science stream, achieving a GPA of 4.17/5.00 in my Higher Secondary Certificate. As I deepened my knowledge of Physics and Mathematics, It makes me excited about applying these ideas outside my textbooks. This made me interested into quantitative finance. At eighteen, I won the chance to trade \$200,000 in proprietary capital with Alpha Capital Group (UK). Through strategies and analytics the portfolio grew up to \$235,314. This experience boosted myself to data-driven systems and engineering. I taught myself HTML, CSS, and Java to build my first website. This eventually led to my first experiments with algorithmic trading systems. I designed High-Frequency Trading algorithms for XAU/USD, creating strategies that performs exceptionally well in back-tested simulations. This mix of software engineering and financial mathematics taught me that code can be more than just instructions; it can represent architecture, and intelligence. To further my skills, I pursued international certifications like:

- Romanian Language A2 Course - EU Academy
- Fundamentals of Data Science & AI – Cambridge International Qualifications (UK)
- Fundamentals of Machine Learning – Amazon Web Services (AWS)
- Zero Trust Cybersecurity & Software Testing – ENISA and the University of Leeds

Alongside, I have contributed to community projects. At the As-Sunnah Foundation, I improved logistics operations. At Volunteer for Bangladesh, I managed environmental initiatives. These experiences taught me that leadership is about boosting team morale and providing structure to a shared mission.

Romania is a place where scientific ambition meets strong academic tradition. The country's STEM programs is a mix of research, practical experience, and European-standard innovation that aligns with my vision as an engineer. I've already attained basic proficiency in Romanian. This will help me integrate smoothly into both the academic and cultural life. I aim to establish Asia's first Humanoid AI-driven Hedge Fund. This institution would use ML, robotics, and advanced HFT infrastructure. My long-term goal is to design financial systems that foster scientific growth and economic empowerment in developing regions. I believe merging engineering with smart capital management can create a significant, measurable impact for future generations.

The Romanian Government Scholarship is the perfect way to transform my skills, experiences, and vision into real innovation. It provides the academic environment, research culture, and international exposure I need to become a global engineer.

Thank you for considering my application.

Sincerely,

Md. Shahariar Nafiz Irfan
